

# AUSTRIA

The total energy savings and emissions reduction potential by improving insulation solutions in industry

**Energy savings potential: 343 ktoe**

**Emissions reduction potential: 885 kt**

The industrial insulation energy savings potential by different energy sources (in ktoe):

**COAL: 20,6**

**GAS: 168,6**

**ELECTRICITY: 1,4**

**OIL: 25,1**

**HEAT: 18,0**

**BIOMASS: 109,4**

The industrial insulation potential to reduce the energy consumption and carbon emissions by industry sector:

Potential by sector in Austria	Energy savings (ktoe)	CO <sub>2</sub> eq. emissions reduction (kt)
Electricity sector*	47	135
Chemical industry	42	103
Refineries	17	59
Paper & Pulp	73	184
Food industry	25	64
Non-metallic minerals	34	92
Steel industry	25	71
Machinery	17	44
Wood industry	42	87
Non-ferrous metal	6	15
Transport equipment	5	11
Textile	3	8
All other sectors	5	13
<b>TOTAL</b>	<b>343</b>	<b>885</b>

CARS

# EU 27 to be climate-neutral by 2050

The European Union has set itself two ambitious climate goals: to reduce greenhouse gas emissions by at least 55% by 2030 and to be climate-neutral by 2050, with net-zero emissions. Decarbonising EU industry is one of the major challenges for reaching this target. The good news is that there are effective short-term industrial insulation solutions which are cost-effective to the asset owners and ready to deliver.

The EiiF Study 2021 analyses that 14 Mtoe of energy can be saved by improving insulation standards in industry, offering the potential to reduce the EU's CO<sub>2</sub> equivalent emissions by 40 Mt every year. The annual industrial insulation savings potential for EU 27 is equivalent to the annual energy consumption of more than 10 million households or more than 20 million cars. The calculation is based on the national average energy consumption provided by the Odyssee-Mure EU project ([www.odyssee-mure.eu](http://www.odyssee-mure.eu)).

## Why is there still such a high industrial insulation potential in EU industry?

Several factors contribute to the tendency in industry to insulate less rather than implement more energy-efficient insulation systems: the pressure to reduce investment and maintenance costs, an increasing lack of insulation know-how and split responsibilities for energy and maintenance budgets. The energy-efficiency level of insulation in Europe's industrial installations is relatively low.

The existing insulation systems and technical requirements most often solely focus on safety to keep surface temperatures below 55 °C. Moreover, many plants in the EU 27 are aging and in a dire need for insulation repair.

The biggest part of the growing – but with energy-efficient insulation easily avoidable – carbon emissions in industry comes from uninsulated equipment or equipment which has damaged insulation.

Depending on the temperature, the increasing share of uninsulated or damaged insulation systems varies from 10% to 2%. Insulating uninsulated equipment and repairing damaged insulation offers a large CO<sub>2</sub> and energy savings potential with short payback periods (two years on average and often just a few months).

LOW-TEMPERATURE < 100 °C	MIDDLE-TEMPERATURE 100 °C - 300 °C	HIGH-TEMPERATURE > 300 °C
<b>10%</b>	<b>6%</b>	<b>2%</b>

## About the EiiF analysis

As the source of information, EiiF used the database from Enerdata and the Odyssee-Mure EU project providing data of the total energy use.

For defining the insulation energy savings potential, EiiF only considered the share of thermal energy consumed in each sector and estimated which part of it can be influenced by insulation.

*\*EiiF exclusively considered gas, coal, oil and biomass technologies in its study. However, insulation energy efficiency potential also exists in carbon-free technologies like nuclear and some renewables.*

More information can be found in [EiiF's White Paper](#) and on [www.eiif.org/publications](http://www.eiif.org/publications)
